About the Cover:

The cover photo highlights LLE’s scientist Dr. Dustin Froula (right) with his postdoc Dr. Tomline Michel (left) who have led laser–plasma interaction (LPI) experiments on the OMEGA Laser System. Direct-drive ignition is susceptible to LPI's that depend on multiple laser beams. Cross-beam energy transfer (CBET) and two-plasmon decay (TPD) are two such instabilities that are driven by the overlapping multiple laser beams. The CBET instability can reduce the hydrodynamic efficiency, while TPD may reduce the compression efficiency. To gain a thorough understanding of these instabilities in ignition-relevant plasma conditions, a series of LPI experiments has been performed on the OMEGA Laser System. The TPD results indicate that, in general, the hot-electron production depends on the configuration of the laser beams and the sum of the intensities of the beams that share the same angle with the common electron plasma wave. This is explained by recent multibeam TPD growth rate calculations that indicate the maximum gain for TPD exists, in general, outside of the plane defined by the laser beams (figure below). These studies have led to a deeper understanding of the instabilities and to potential mitigation strategies for both CBET and TPD.

This report was prepared as an account of work conducted by the Laboratory for Laser Energetics and sponsored by New York State Energy Research and Development Authority, the University of Rochester, the U.S. Department of Energy, and other agencies. Neither the above-named sponsors nor any of their employees makes any warranty, expressed or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, mark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof or any other sponsor. Results reported in the LLE Review should not be taken as necessarily final results as they represent active research. The views and opinions of authors expressed herein do not necessarily state or reflect those of any of the above sponsoring entities.

The work described in this volume includes current research at the Laboratory for Laser Energetics, which is supported by New York State Energy Research and Development Authority, the University of Rochester, the U.S. Department of Energy Office of Inertial Confinement Fusion under Cooperative Agreement No. DE-FC52-08NA28302, and other agencies.
