### Proton Core Imaging Spectroscopy on OMEGA Implosions

Brook Schwartz et.al. Plasma Science and Fusion Center Massachusetts Institute of Technology 44<sup>th</sup> Annual Meeting of the Division of Plasma Physics November 11-15<sup>th</sup>, 2002 Orlando, Florida

#### Abstract

Multiple pinhole cameras are being used to image the burn regions in implosions of both thin (~2  $\mu$ m-glass) and thick (~20  $\mu$ m-CH) shell capsules on OMEGA. Because the pinholes are generally much larger than the burn region, information about the proton source (i.e. size, shape, and symmetry) can be extracted from the "penumbra" of the resulting images. Capsules with D<sup>3</sup>He and DD fills have been studied with Proton Core Imaging Spectroscopy (PCIS). For thin-shell capsules, experimental differences in the burn regions between DD and D<sup>3</sup>He reactions will be explored, contrasted, and compared to 1-D calculations. Particularly intriguing is the situation for thick shell implosions. At first shock coalescence, the escaping charged particles sample a relatively small  $\rho$ R. At bang time (a few hundred ps after shock coalescence), however, only the energetic 14.7-MeV protons escape, since they sample a much larger  $\rho$ R (~70 mg/cm<sup>2</sup>). Comparisons of the shock and compression burn regions will be made.

This work was performed in part at the LLE National Laser Users' Facility (NLUF), and was supported in part by the U.S. Department of Energy Office of Inertial Confinement Fusion (Grant number DE-FG03-99DP00300 and Cooperative Agreement number DE-FC03-92SF19460), LLE (subcontract P0410025G), LLNL (subcontract B313975). • Proton core imaging spectroscopy (PCIS) gives information about radial burn profiles of DD and D<sup>3</sup>He reactions.

• PCIS provides radial burn profiles of DD and D<sup>3</sup>He protons from D<sup>3</sup>He implosions of thin and thick shell capsules at shock and bang time.

 For thin (~2µm) shell capsules, a temperature profile is inferred by comparing burn profiles of DD protons (3 MeV) and D<sup>3</sup>He protons (14.7 MeV).

• For thick (~20μm) shell capsules, compare DD proton burn profile at shock time with D<sup>3</sup>He burn profile at bang time.

# PCIS simultaneously images protons from DD and D<sup>3</sup>He reactions

 $D + {}^{3}He \rightarrow \alpha$ [3.6 MeV] + p[14.7 MeV]

**Bang time** 

D<sup>3</sup>He(18 atm) SiO<sub>2</sub>[2 μm]

## PCIS images proton emissions on to CR-39 plastic

# Filters are placed in front of the CR-39 to adjust which particles will be detected

Filter thickness is set so that "Bert" is sensitive to DD protons and "Ernie" is sensitive to D<sup>3</sup>He protons

### The penumbra of the image contains information about the burn profile

#### D<sup>3</sup>He Proton tracks / cm<sup>2</sup> in the plane of the CR-39 Shot 25599: D (6) <sup>3</sup>Ho(12) CH[20]

(Shot 25599: D<sub>2</sub>(6) <sup>3</sup>He(12) CH[20])

Step 1: Calculate the number of proton tracks per unit area N as a function of radius in the image plane.

Step 2: Calculate dN/dr.

#### Finding the radial burn profile (part 1)

0

0.6

Step 3: Use analytic inversion formula with system geometry to get radial profile of the proton emissivity in the capsule. (In this case, dN/dR is fit by a gaussian.)

## Analytic inversions for two simple source functions\*

\*Exact only in the limit where pinhole diameter >> source diameter, but with very little error (< 5%) for the finite pinholes used here.

## Comparison between burn profiles from uniform and gaussian source functions

Shot 27808: D<sub>2</sub>(6) <sup>3</sup>He(12) CH[20]

Width calculated by default = 624.6  $\mu$ m Minimum width = 616.2  $\mu$ m (found with center displaced by dx = 100  $\mu$ m, dy = -10  $\mu$ m)

Error in the default values ~ 1.4%.

Radius (cm)

## DD and D<sup>3</sup>He protons are imaged for implosions of thin glass shell capsules at bang time

### Burn profiles of DD and D<sup>3</sup>He protons from a thin (1.8µm) glass shell D<sup>3</sup>He implosion

Shot 27456: D<sub>2</sub>(6) <sup>3</sup>He(12) SiO<sub>2</sub>[1.8]

### Temperature T<sub>i</sub>(r) can be inferred from the DD and D<sup>3</sup>He proton burn profiles

Shot 27456: D<sub>2</sub>(6) <sup>3</sup>He(12) SiO<sub>2</sub>[1.8]

## Yield averaged temperatures compared to results from other diagnostics

Shot 27456: D<sub>2</sub>(6) <sup>3</sup>He(12) SiO<sub>2</sub>[1.8]

Diag.	Y <sub>D3He</sub> [×10 <sup>10</sup> ]	Y <sub>DD</sub> [×10 <sup>10</sup> ]	<t<sub>i&gt;<sub>D3He</sub> [keV]</t<sub>	<t<sub>i&gt;<sub>DD</sub> [keV]</t<sub>
PCIS	1.3	4.2	~ 15	~ 8
WRF	1.2	-	14	-
nTOF	-	5.0	-	~ 10

 $< T_i > ~ 6-7 \text{ keV}$ from the ratio of the total yields  $Y_{DD}/Y_{D3He}$  determined from PCIS

### Results from a thin shell capsule implosion are compared to 1-D simulations

Shot 27456: D<sub>2</sub>(6) <sup>3</sup>He(12) SiO<sub>2</sub>[1.8]

#### Burn profiles of DD and D<sup>3</sup>He protons from a thick (20μm) CH-shell D<sup>3</sup>He implosion

### Burn profiles of DD and D<sup>3</sup>He protons from several thick shell capsule implosions

Yield comparison of all thick shell profiles

	Bert			Ernie		
Shot #	Y <sub>DD</sub> PCIS (x10 <sup>8</sup> )	1/e point		Y <sub>D3He</sub> PCIS (x10 <sup>8</sup> )	Y <sub>D3He</sub> WRF (x10 <sup>8</sup> )	1/e point
27806	1.3	100		3.7	3.7	45
27808	0.9	110		2.7	2.2	40
27810	1.2	110		2.4	1.8	45
27811,12*	1.2	80		1.9	1.9	40

\*PCIS summed over two shots. Yields for this data are normalized.

- With Proton Core Imaging Spectroscopy (PCIS), the first burn profiles of DD and D<sup>3</sup>He reactions have been obtained of thinand thick-shell implosions
- T<sub>i</sub>(r) and n<sub>i</sub>(r) profiles have been inferred for thin-shell implosions and compared to 1-D simulations
- Burn profiles of DD and D<sup>3</sup>He reactions at shock coalescence and at bang time have been measured for thick shell implosions.

- Optimize PCIS instrumentation.
- Begin to build up a data base of images, and establish the range of PCIS applicability.
- Compare PCIS to x-ray and neutron images.
- Compare PCIS to 1-D and 2-D simulated images.
- Investigate asymmetries in burn region, and develop algorithms to treat asymmetries.
- Obtain orthogonal images.
